RASTER Run

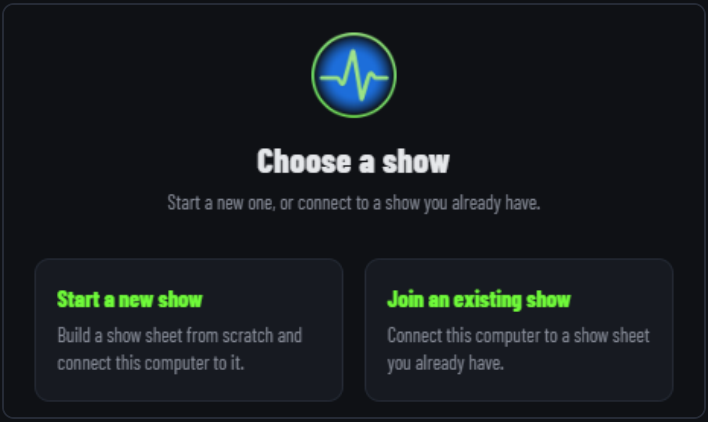

# Raster Run: quick reference

Checks every device on your show network against your tech sheet.

QUICK REFERENCE
V0.1.15

## 1 First run: Choose a show

- **Start a new show:** a name, the venue and year, and a **Show ID** (1 to 254; on an existing network, use the one it's built on). Then **Create Show**, and sign in with Google.
- **Join an existing show:** sign in, then **Pick Your Sheet**.

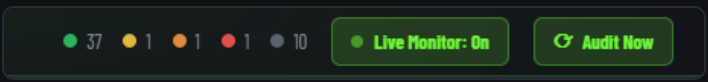

## 2 Add your gear

On the sheet's **GEAR INDEX** tab: Device Name, Device ID and Networks. The dashboard fills in by itself.

## 3 Plug in and audit

Cable this computer to the show switch, then press **Audit Now** (top right).

Can't see the show? Use **Settings → This Computer → Set up this computer's network**.

## 4 Read the colors

- **Verified:** answered as the sheet says.
- **Partial:** some of its networks answered, not all.
- **Alarm:** it answers, but reports a fault of its own (SNMP).
- **Failed:** no answer.
- **Grey:** not monitored, or not checked yet.

**STALE** on screen means the data is old. It clears on the next good read.

Needs Attention lists what to look at first.

## 5 On a phone

Same network: `http://raster.local:5000`, or this computer's IP address followed by `:5000`.

The dashboard on a phone: Needs Attention first.

### When something's wrong

Every message ends in a code, like **(TS-SHEET-001)**. Send it with **Send feedback** (check *Include my error log*), or to support@rastertech.app.
